🏃 Olav

An AI coach that plans around your real life and ships the session to your watch

Garmin + Google Calendar + Telegram

Built with **Cline · Composio · Parallel · Hermes Agent**

`github.com/enzojunq/Olav`

The problem

- Training plans assume a perfect week. Real weeks have travel, meetings, bad sleep and missed sessions.
- Multi-sport athletes (run + gym + bike + swim) re-plan by hand **every day** across 3 apps.
- Generic AI chat can't see your watch or calendar, and it shouldn't be trusted to overtrain you.

Who it helps: amateur endurance athletes with a goal and a busy calendar.
First user: me, training for a **December half marathon**, keeping gym 2x/week and bike + swim for a 2027 triathlon, with an **8h/week** budget.

What it does (daily loop on Telegram)

1. **Context**: sleep, readiness, activities, **last watch sync**, calendar (travel, meetings)
2. **Plan vs reality**: done / partial / missed / unplanned, plus conflicts
3. **Proposal**: keeps / changes / **why**, checked against the limits **in code**
4. **"aprovo"**: a structured workout goes to the **Garmin watch** and a `[Coach]` event to **Google Calendar**
5. **Follow-up**: planned vs actual is saved to history and feeds the next plan

How it works

```
Telegram ──► Hermes Agent (Docker, ChatGPT/Codex)
             skill: training-coach (5 steps + approval rule)
             ├──► wearable-mcp (ours) ──► Garmin Connect
             │      WearableProvider interface → add Coros/Polar later
             │      guardrails.py: 8h/wk, ≤2 hard, no hard days in a row,
             │                     poor sleep → no hard, taper
             │      propose_plan → plan_id → apply_plan (2-phase writes)
             ├──► Composio MCP ──► Google Calendar (availability + events)
             └──► Parallel Search MCP ──► gyms/pools/routes when travelling
```

Safety: the LLM can only send a workout that passed `propose_plan`, and only with explicit approval.

Demo & what's next

- Real data: Forerunner 965 sync, sleep score, rides in SF, calendar trip to Raleigh, all live.
- Real writes: a structured workout (warm-up / 3×8' at pace / cool-down) appears on the watch.
- **Simulated:** only the `mock` provider used in tests.

Next: auto-trigger after each activity, more brands (Coros, Polar, Apple Health), race-specific periodization, and Strava/Whoop context.
